Skogforsk - *The Forestry Research Institute of Sweden, Sweden*

Logistic challenges in Swedish Forestry

Résumé

The seminar will give an overview of the main challenges in forestry logistics from a Swedish perspective. An increasing energy sector requires new solutions for planning and decision support. In order to reduce emissions from transports of roundwood- and forest fuel transports new vehicle configurations are tested as well as intermodule transports.

Decision support systems(DSS) for wood flow planning have been used for some years and DSS for operative transport planning (truck routing) have been tested and will be implemented in practise within a few years. Infrastructure and technique can be used in more efficient ways. Some examples will be given. The presentation will focus on on-going projects at Skogforsk.
